

# PiKey

**Making small-keyboard microcomputers usable for old dudes with big hands**

**Brendan and Morgan Donahe**

**February 2025**

# Overview

- PiKey is overarching project name; goal to provide USB keyboard and Atari joystick/Sega Genesis joypad support
- PiKey-10 model targets limitations of TRS-80 MC-10 Micro Color Computer
  - Miniature chiclet keyboard
  - No joystick ports
- Employs key components
  - Raspberry Pi Pico 1 (2020)
  - Zarlink MT8808 8x8 analog switch matrix chip

# PiKey-10 History

- Project started spring 2022
- Purpose as described above, emulation of keyswitch closures via USB in as non-invasive and backwards-compatible method as possible
- Inspired by Kyle Wadsten's NEWKEY/80 for Z80-based TRS-80s
  - Was originally using discrete transistors
  - Following light collaboration, Kyle has also migrated to MT8808
  - <https://www.plaidvest.com/newkey80.html>

**Summer 2022**  
**Breadboard Prototype**

**Fall 2022**  
**Perfboard Prototype**

**Summer 2023**  
**PCB and 3D-Printed Riser**  
**Prototype**

**Demo'ed at:**  
**CoCoFEST!**  
**Classic Game Fest**  
**Tandy Assembly**  
**VCF SW**  
**VCF West**

**ALMOST 2 DOZEN**  
**sold!**

# PiKey-10 Hardware Design

Danjovic)

## MT8808

**Reset – GPIO2**

**Strobe – GPIO3**

**Data – GPIO6**

**AY[2:0] – GPIO[8:10]**

**AX[2:0] – GPIO[11:13]**

**Joysticks || Pullups**

**Joy0 – GPIO[21:28]**

**Joy1 – GPIO[16:20]**

**Debug UART**

**UART0 TX – pin 1**

**UART0 RX – pin 2**

- PiKey-10 board powered by 5VDC from 7805 regulator on MC-10 mainboard; Raspberry Pi Pico has its own voltage down-regulation
- Micro USB port OTG (On-The-Go) standard, therefore dual purpose
  - Program onboard flash with code image; field upgradeable
  - OTG adapts to USB-A female host for wired keyboard
- Simultaneous use of both USB keyboard and original keyboard possible due to switches (virtual and physical) electrically in parallel
- Joystick ports male DE-9
  - Pinout compatible with both Atari joystick and Sega Genesis control pad
  - Sega Genesis control pad limited to D pad and B button only

# PiKey-10 Software Design

- Development and cross-compilation via Raspberry Pi 400
- Uses TinyUSB protocol stack on bare metal (no OS)
- Derived from `host_cdc_msc_hid` demo application
- General structure
  - `main()` initializes components on board and starts event loop
  - `process_kbd_report()` performs table-driven conversion of USB key down/up events to MT8808 switch close/open sequences; pushes these into queue with encoded millisecond delays
  - `hid_app_task()` pops queued events and handles them in time-aware method

- Autotype capability for on-screen feedback to user
- Additional meta mode access via GUI key
  - Keyboard mode (GUI-K)
    - Touch-type mode (keyboard WY"Type"IWYG)
    - MC-10 mode (legacy retrocomputer user muscle-memory-friendly)
  - Joystick remapping mode (GUI-J)
    - Alter default joystick 0 and joystick 1 to keypress mapping
  - Verbose mode (GUI-V) for user guidance regarding above features

# PiKey-10 HW 0.3 SW 0.25

# The Future...

- Other small membrane or chiclet keyboard microcomputers
  - Timex/Sinclair 1000 a.k.a. ZX-80 and ZX-81
  - Timex/Sinclair 2068
- Feature enhancement requests
  - Porta-MC-10 (<https://portacoco.com/porta-mc-10/>) - ability to remap joystick using stock MC-10 keyboard
  - Auto key repeat; should only apply to USB keystrokes, not joystick events
  - Integration with MC-10's 6803 UART
  - Improve compatibility with USB keyboards beyond ~75%
- For more info monitor <http://pikey.tech/>
